Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Apparatus for detecting small molecules, especially explosives comprises a piezoelectric crystal.

Disclosure; Fig 3A; 90pp; English.

The present sequence is the heavy chain variable region of 5B3 antibody. The CDNA encoding this sequence was obtained from total RNA extracted from a 5B3 hybridoma by RT-PCR. 5B3 is an igg1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for a detecting small assayed explosive molecules. Molecules are detected using a piezoelectric sensor. Piezoelectric immunoassaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight molecules

New laminin-5 gamma2-binding peptide that competes with mAb 5D5, mAb 6C12, or cross-competes with both 5D5 and 6C12, useful for diagnosing 6C12, or cross-compercontracting, or preventing cancer.

Disclosure; SEQ ID NO 86; 338pp; English

The invention relates to a peptide that competes with mab 5D5, mab 6C12, or cross-competes with both 5D5 and 6C12 in specifically binding to at least a portion of domain III of the gamma2 chain of human laminin.5 (Ln-5 gamma2 DIII). Also included are a composition comprising an amount of the isolated peptide and a pharmaceutical carrier, an assay for assessing the genara2-associated peptide content of a composition (comprising and ministering the peptide to the composition and attention whether the peptide binds any gamma2-associated peptides in the composition), a method of reducing cancer progression in a patient and a method of treating cancer in a patient. The peptide is a monoclonal antibody, preferably a humanized antibody or a fully human antibody. It binds a protein that is secreted from human cancer cells and or compound that kills cancer cells and/or to a detection agent. The peptide, or both the peptide and the nucleic acid, and the composition are useful in the preparation of a medicament for the treatment of cancer. The peptides, nucleic acids, and the composition are useful in the preparation of a medicament for the treatment of cancer. The peptides, nucleic acids, and composition are useful in the preparation of a medicament sequence represents a Anti-laminin-5 gamma2 antibody heavy chain. ADZ81889

A

The invention relates to an antibody or its fragment, capable of extracellular region of a polypeptide encoded by a p53 apoptosis effector related to PMP-22 (PERD) gene. The invention also relates to a hybridoma that produces the antibody, a DNA encoding the antibody, a recombinant vector comprising the DNA, a host cell obtained by transducing the vector to the host cell, a method of producing the antibody and a therapeutic of the host cell, a method of producing the antibody and a therapeutic useful in an immunosessy for measuring the polypeptide encoded by the PERP gene, in the cell. The immunosessy is immunoprecipitation. The antibody is useful for measuring the expression of a polypeptide encoded antibody is useful as a reagent for detecting the polypeptide encoded antibody is useful as a reagent for detecting the polypeptide encoded antibody is useful as a reagent for detecting the polypeptide encoded by the PERP gene and for diagnosing the disease associated with a

Novel antibody capable of binding to three-dimensional structure of extracellular region of polypeptide encoded by p53 apoptosis effector related to PMP-22 gene, useful for manufacturing diagnostic and therapeutic agent for cancer.

polypeptide encoded by the PERP gene. The disease is cancer. The antibody is useful in diagnoshing a disease by detecting or measuring the amount of a polypeptide encoded by the PERP gene in a cell, for treating cancer, for manufacturing a diagnostic, for detecting cancer and for manufacturing a therapeutic agent for cancer. This sequence represents a marine BERP related protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Monoclonal antibodies which inhibit type II phospholipase A2 are useful in the treatment of myocardial infarction, cerebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, pancreatitis, adult respiratory distress syndrome and colitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma P3U1 (P3x63Ag8.U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12H5, 1.4 and 10.1. These were cultured and the antibody isolated from the culture supernatant by precipitation with ammonium sulphate and purification on a column of protein A Sepharose CLAB. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is particularly suitable for preclinical testing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 CNKLEWMGYISYSGFISYNPSLRSRISFTRDISKNOFFLOLNSVISEDTATYYCAR---- 116

disorders (such as acute renal failure) associated with the
administration of cisplatin for the treatment of cancer. The method
comprises treatment with a monoclonal antibody which inhibits the
activity of type II phospholipase A2 (particularly of type II
possessing the same inhibitory activity and containing a part of the
antibody sequence. Preferably the antibody also inhibits the activity of
appearance in phospholipase A2, and has the ability to release
type II phospholipase A2, and has the ability to release
type II phospholipase A2, and has the ability to release
type II phospholipase A2, bound to a cell membrane. Three specific
monoclonal antibodies having these properties which can be used are 12H5,
10.1 and 1.4, derived from hybridomas FERM BP-5300, FERM BP-5298 and FERM
BP-5297 respectively. The method can be used for suppressing the
nephrotoxicity which is a characteristic feature of cisplatin
administration, and therefore allowing more efficient use of this drug as
an anticancer agent, e.g. by allowing an increased dosage to be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GNKLEWMGYISYSGFTSYNPSLRSRISFTRDTSKNQFFLQLNSVTSEDTATYYCAR---- 116

                                                                                                                                                                                                                                                                                                          9
                                                                                  The sequences given in AAR28670-71 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL-6R). The antibody comprises light (L) chain and heavy (H) chain variable regions which were derived from a mouse monoclonal antibody produced from the hybridoma PMI which contained the plasmids pPM-k3 and pPM-h1. (Updated on 25-MAR-2003 to correct PN field.)
            human interleukin-6 receptor - has low V-region complementarily determining

```
The invention relates to an isolated specific binding member (I) which recognizes an epidermal growth factor receptor (EGFR) epitope which is found in tumouriganic, hyperproliferative or abnormal cells and not detectable in normal cells. The EGFR epitope is located within the region comprising residues 273-501 of EGFR and does not demonstrate any amino acted sequence alterations or substitutions from normal EGFR. (I) is capable of binding the de2-7 EGFR at an epitope distinct from the bearrant expression, or in the absence of amplification of normal wild-type gene. The binding member comprises the VH and VL compyreptide sequence of monoclonal antibody (mAb) 806. (I) is useful for treating or diagnosing human or animal body, especially for treating tumour in a human. (I) is useful for the preparation of a medicament and to preventing or treating cancer which is located in or adjacent the brain, in a mammal. (I) is also useful for detecting the presence of amplified EGFR, de2-7EGFR or EGFR with high mannose glycosylation, where the brain, in a mammal. (I) is also useful for detecting that allow binding of the EGFR to the antibody to occur, and detecting that allow binding of the EGFR to the antibody to occur, and detecting whether binding has occurred between the EGFR from the sample and the antibody, where the detection of binding indicates that presence or activity of the EGFR in the mement of a tumour or cancer in the mammal. A pharmaceutical composition comprising (I), and optionally webicle, carrier or diluent is useful for detecting cancer in mammals, especially for treating brain-resident cancer in the mammal, accomposition comprising (I) and optionally webicle, especially for treating brain-resident cancers that produce aberrantly expressed EGFR in mammals, such as glioblastoma, medulloblastoma, meningioma, neoplastic ancers that produce aberrantly sypressed EGFR in earth to mammals. The present espresents the mammals constructions in mammals. The present espresents the preparent in mammals constructions 
                           Novel specific binding members, particularly antibodies recognizing epidermal growth factor receptor epitope found only in tumorigenic cuseful for diagnosing, preventing and treating cancer in mammals.

Mus musculus

having agonist activity with respect to a variant receptor. A ligard of the invention has antidiabetic, haemostatic, and endocrine-gen, activity. The ligand is useful for treating the disease caused due to variant receptor, which involves combining the disease caused due to variant receptor, where the disease is congenital non-megakaryocyte thrombocytopenia. A ligand of the invention is useful for transmitting a signal to a variant receptor which involves combining the variant receptor with the ligand of the invention is useful for treating diseases resulting due to variation receptor, such as type II diabetes and laron syndrome. The ligand enables signal transduction function of thrombopotetin, with respect to variant receptor. The present sequence is used in the exemplification of the invention. 61 GNKLEWMGYISYSGFTSYNPSLRSRISFTRDTSKNQFFLQLNSVTSEDTATYYCARWDYG 120 61 GNKLEWMGYITYSGYSIYNPSLKSRISISRDTSKNQLFLQLNSVTTEDTATYYCV---- 115 9 9 Novel ligand having agonist activity with respect to variant receptor e.g., variant thrombopoietin receptor, useful for treating disease resulting due to variant receptor such as congenital non-megakaryocyte 1 MRVLILLWLFTAFPGILSDVQLQESGPGLVKPSQSLSLTCSVTGYSITSGYAWNWIRQFP 1 MRVLIPLWLFTAFPGTLSDVQLQESGPGLVKPSQSLSLTCTVTGYSITSDYAWSWIRQLP Gaps The invention relates to a novel ligand (preferably an antibody) (I) Score 569.5; DB 8; Length 255; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                 having agonist activity with respect to a variant receptor. A ligand of the invention has antidiabetic, haemostatic, and endocrine-gen. activity. The ligand is useful for treating the disease caused due to variant receptor, which involves combining the ligand/antibody with the variant receptor, where the disease is congenital non-megakaryocyte thrombocytopenia. A ligand of the invention is useful for transmitting a signal to a variant receptor which involves combining the variant receptor with the ligand. The invention is useful for transmitting a resulting due to variation receptor, such as type II diabetes and laron syndrome. The ligand enables signal transduction function of thrombopoietin, with respect to variant receptor. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GNKLEWMGYISYSGFTSYNPSLRSRISFTRDTSKNQFFLQLNSVTSEDTATYYCARWDYG 120

                                                                                                                                                                                                                                                                                                                                                                              The specification describes a monoclonal antibody, designated anti-C3-2, which specifically binds on a functional domain exposed on native human C3, thus inhibiting the generation of the biologically active peptides such as C3a and C5a. The functional domain is in part located on the 23 kD-a-chain fragment of C3c. The antibody is useful for the preparation of preventing or inhibiting complement activation, preferably for preventing or treating inflammatory diseases mediated by activation of complement. The present sequence represents the consensus sequence of the from N-terminal sequencing, primer-induced sequence and sequence of the from N-terminal sequencing, primer-induced sequence and sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 DVQLQESGPGLVKPSQSLSLTCTVAGYSITSDYAWNWIRQFPGNKLEWMGYISYSGSTSY 60

The specification describes a monoclonal antibody, designated anti-C3-2, which specifically binds on a functional domain exposed on native human C3, thus inhibiting the generation of the biologically active peptides such as C3a and C5a. The functional domain is in part located on the 23 kD-a-chain fragment of C3c. The antibody is useful for the preparation of a medicament for inhibiting complement activation, preferably for preventing or treating inflammatory diseases mediated by activation of complement. The present sequence represents the heavy chain region of the monoclonal antibody anti-C3-2.

fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or spidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                  7

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a ctivation of the IGF-IR and/or EGFR, and/or of EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin treceptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent and/or IERZ/neudependent cells into the contract.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (1), which is optionally labeled. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer, osteosarcoma, lung cancer, breast cancer, endometrial cancer or colon cancer. (I) is useful in the preparation of a medicament intended for the prevention or for the treatment of psoriasis. Duflos A, Haeuw J,

Leger O,

The invention relates to a novel humanized anti-insulin like growth factor I receptor (IGF-IR) antibody (Ia), anti-insulin/IGF-5 hybrid receptor (IGF-IR) antibody (Ib), or anti-iGF-IR and hybrid-R antibody (Ic) or their antigen-binding fragments, comprising a complementary determining region of non-human origin and a framework region having a human residue, and capable of inhibiting in vivo tumor growth. A composition of the invention has cytostatic activity. An antibody of the invention is useful for determining regression progression or onset of a pathological disorder characterized by increased expression and/or activation of human IGF-IR, hybrid-R to both IGF-IR and hybrid-R relative to normal. A pharmaceutical composition of the invention is useful for the treatment or prevention of a disorder chosen from breast cancer, the treatment or prevention of a disorder chosen from breast cancer, colorectal cancer, blanded cancer, blanded cancer, colorectal cancer, backers and myebloma. The present sequence represents a heavy chain variable region isolated from monoclonal antibody 7C10.

New humanized anti-insulin like growth factor I receptor (IGF-IR) antibody, anti-insulin/IGF-5 hybrid receptor (hybrid-R) antibody, or anti-IGF-IR and hybrid-R antibody, for treating cancer.
